Bayesian programming applied to Starcraft

A summer project experiment: or why we can't come to the beach

Gabriel Synnaeve

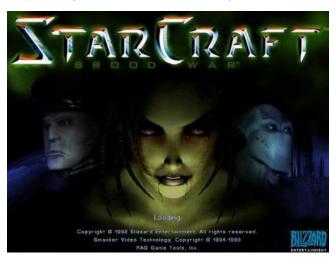

University of Grenoble / E-Motion @ INRIA

December 1, 2010

- What is Starcraft?
 - "Best" RTS in the world
 - Starcraft 101
 - An interesting problem
- AIIDE 2010 competition (AAAI)
 - 4 Tournaments
 - Tournament 1
 - Tournament 4
- Our approach
 - Bayesian programming
 - High level model
 - Units as Bayesian robots
- Code & Results
 - Interfacing with Starcraft
 - Implementation
 - Results at AIIDE 2010

Starcraft: Broodwar

Starcraft (January 1998) + Broodwar (exp., November 1998)

RT what?

Manage Economy

Produce Units

Pro gaming and competitions

eSports, sponsorship, tournaments' dotations, salaries (Korea)

WORLD CYBER GAMES

The World Cyber Games is the world's first "Cyber Game Festival", designed to build a healthy cyber culture.

The best gamers around the world gather into different cities to share the excitement and fun of the game tournaments.

Starcraft in numbers

- 11 years of competitive play
- 200 to 300 actions per minute amongst pro gamers
- 10 millions licenses sold (4.5 in South Korea)
- **\$60000** average pro gamer salary (average South Korean: \$16000)
- 1/4 TV channels are displaying Starcraft games in Korea
- 160 BPM: reached rates of pro gamers hearts
- 3 millions licenses sold for Starcraft II in 1 month (1 million in 24 hours, released July 27, 2010)
- 4.9 millions South Koreas still playing SC:Broodwar (August 2010)

Micro/Macro

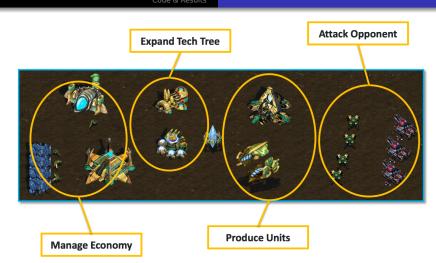

Macro - Economy and Strategy

4 resources:

- Minerals: basic resource, needed for every production
- Gas: advanced resource, needed for "high tech" building/units/research/upgrades
- Food cap: needed to increase it to produce units
- Time: everything takes time to build
- \rightarrow Develop tech tree
- → Develop production capacity
- → Produce units
- \rightarrow Enhance units

Starcraft 101
An interesting problem

Micro - Tactics and Unit Management

Micro-management is using your units as close as possible to the maximum outcome you can have with them.

Basically, units have:

- Hit points
- Size
- Speed
- Can fly (or not)
- Energy points
- Spells

Basics:

- Focus fire weak units / high damage units
- Retreat wounded units
- Cast spells
- Placement (short time tactics)

Toy problem?

Multiplayer video games AI:

- Simulated: no sensors problems
- Multiplayer: real humans
- Closed and rich worlds
- ⇒ Good in-between real world / simulation.

Starcraft specifically

- Chess / Go / Rock-paper-scissors
- Real-time (1/24th second per micro-turn)
- Machine learning ready (replays)
- Al competitions

Open tournament

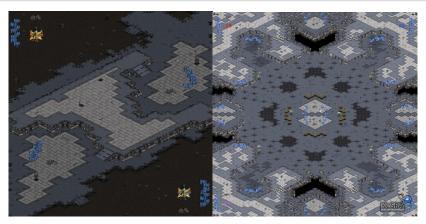

- Expressive Intelligence Studio at University of Santa Cruz (UCSC)
- Ben Weber announced the tournament in November 2009 at AIIDE
- Free participation
- Open to all
- Began work on it in March 2010 as a pet project
- Due for the 15th of September (2010)

Micro-based tournaments

Micro-management: flat map; Small-scale combat: cliffs

Normal games

Tech-limited: small map, only zealots/goons;

Full game: real (competitions, progaming) maps

Challenges in micro-management

Fight well, move well, think fast:

- Select targets
- Don't stuck units (very hard!)
- Predict (close) future
- Be efficient (200x200, 1/24th of a second)

Challenges in full games

Chess in real-time:

- Do not bug/freeze/slow down
- Predict oponents strategies and tactics
- Be able to counter/handle any strategy
- Know when to attack and when not
- Micro-manage well in different environments
- A lot of other tasks
- Do not bug/freeze/slow down
- Do not bug/freeze/slow down
- ..

Bayesianism

EDWIN T. JAYNES

 ${\it ``Cone''} disadvantage of having a little intelligence is that one can invent myths out of his own imagination, and come to believe them. \\ {\it ``Cone in the little intelligence is that one can invent myths out of his own imagination, and come to believe them. \\ {\it ``Cone in the little intelligence is that one can invent myths out of his own imagination, and come to believe them. \\ {\it ``Cone in the little intelligence is that one can invent myths out of his own imagination, and come to believe them. \\ {\it ``Cone in the little intelligence is that one can invent myths out of his own imagination, and come to believe them. \\ {\it ``Cone in the little intelligence is that one can invent myths out of his own imagination, and come to believe them. \\ {\it ``Cone in the little intelligence is the litt$

Transmute incompleteness into uncertainty

Incompleteness

Uncertainty

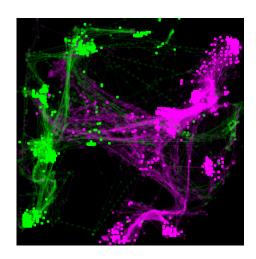

- Many low level moves achieving the same high level goal
- Fog of war (limited sight)
- Partial knowledge of opponent's force (size and composition)

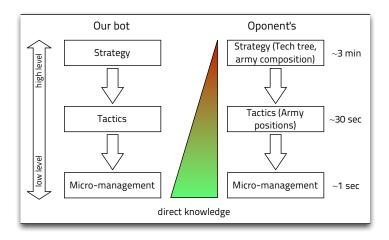

- Considering the units as individual Bayesian robots
- Seen units (viewed units filter)
- Probabilistic inference, machine learning from replays

Machine learnings

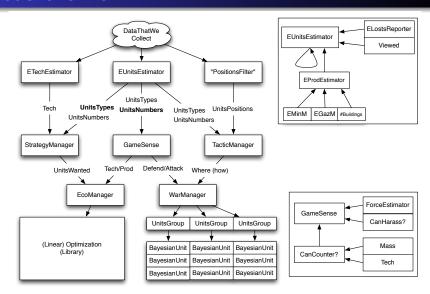

- from replays (parameters of predictive models)
- reinforcement (exploration of parameters space for the Bayesian robots)
- online (adapt to particular opponent)

Problems to tackle

Model overview

The Bayesian unit (1)

The workers are *not* controlled as (Bayesian) sensory motor systems as their tasks are extremelly simple.

Modal unit, can be simplified as:

- Scout
- Move (small / large group)
- In position
- Fight:
 - Attack
 - Fight-move
 - Flee

} When not attacking

The Bayesian unit (2)

Mode dependant influences, as:

- "statically" occupied tiles
- "dynamically" occupied tiles
- height
- damage map (+ gradient)
- pathfinder
- ...

The Bayesian unit, Fight-move example (1)

Variables:

- $Dir_{i \in \{\text{possible directions}\}} \in \{T, F\}, n = \#\{\text{possible directions}\}$
- $Obj_i \in \{T, F\},$
- $Dam_i \in \{no, low, med, high\},\$
- $Rep_i \in \{no, low, high\},\$
- $H_i \in \{0...3\},$
- $Occ_i \in \{no, terrain, building\}$

Decomposition:

$$\begin{array}{lcl} \textit{P}(\textit{Dir}_{1:n},\textit{Obj}_{1:n},\textit{Dam}_{1:n}\textit{Rep}_{1:n},\textit{H}_{1:n},\textit{Occ}_{1:n}) & = & \Pi_{i=1}^{n}\textit{P}(\textit{Obj}_{i}|\textit{Dir}_{i}) \\ & & .\textit{P}(\textit{Dam}_{i}|\textit{Dir}_{i}) \\ & & .\textit{P}(\textit{Rep}_{i}|\textit{Dir}_{i}) \\ & & .\textit{P}(\textit{H}_{i}|\textit{Dir}_{i}) \\ & & .\textit{P}(\textit{Occ}_{i}|\textit{Dir}_{i}) \end{array}$$

The Bayesian unit, Fight-move example (2)

Parameters:

They are hand-specified for the moment but should be learned through task-specific maps and maximization.

Questions:

The pathfinder gives us $Obj_{1:n}$, the damage map $Dam_{1:n}$, the distance to and size of other units $Rep_{1:n}$, etc.

$$P(Dir_{1:n}|Obj_{1:n}, Dam1: n, Rep_{1:n}, H_{1:n}, Occ_{1:n})$$

Bayesian flocking (simplified)

Variables:

- Dir_i
- Obj_i
- Repi

Parameters:

 $P(Rep_i|Dir_i)$ are learned with maze-like maps and on the objective to minimize the time-to-completion.

 Obj_i is not well-defined: We have to divise its value by the number of units flocking together.

Bayesian repulsion (flocking applied to "in position")

(2 youtube videos

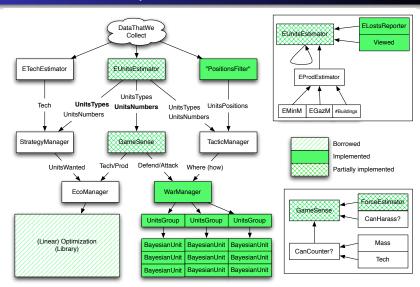

http://www.youtube.com/snippyhollow#p/a/u/1/sMyF_PlDqFo http://www.youtube.com/snippyhollow#p/a/u/2/mvv9kUntLHU) Like flocking but with different parameters (and an additional attractor: the position).

BWAPI

BroodWar API

```
#include <BWAPI.h>
.onFrame()
{
    units = Broodwar->getAllUnits();
    for (set<Unit*>::const iterator it = units.begin();
            it != units.end(); ++it)
    {
        if ((*it)—>isWorker())
            continue:
        if ((*it)->getType() == UnitType::Protoss Zealot)
            (* it )—>attackMove(enemyPosition);
        else
            (* it )->attackUnit(enemyUnit);
```

What has been implemented?

Interesting snags

- Hidden walkable pixels
- Stuck units
- Dealing with lag

To-do code work

Currently:

- Key tests (no "unit" test)
- Synchronous (1/24th second) + threads (pathfinding, storms coverage, planning)

To-do:

- Automate tests (94 test maps)
- Switch to an event-driven paradigm/framework (19498 true lines of C++)
- Add tests
- Implement remaining/new models
- Integrate learnings

Tournament 1

- 7 participants
- Took part, got left out ☺
- FreSC (Epita team) won
- Played against FreSC: draw! (0-3, 3-0, 6-8)

Tournaments 2 & 3

Tournament 2:

- 2 participants
- Didn't took part
- FreSC won

Tournament 3:

- 8 participants
- Didn't took part
- Mimicbot won

Tournament 4

- 17 participants
- Took part, really ©, 0-3, 3-0, 1-3 passed one round only ("top 8").
- Eliminated because of a (lame) strategy not handled correctly (bug)
- Overmind (UC Berkeley team) won

Team Overmind:

- 13 members (Ph.D students)
- 1 member took part in WCG 2001
- http://overmind.cs.berkeley.edu/

Half-satisfying results

- Not all have been implemented ②
- What have been implemented performed well ©
- ... after tweaks & hacks ©
- We keep on working on Starcraft ©
